It is by far the most important aspect of the central nervous system in both humans and other mammals. The brain stem plays a role in such functions as control of heart rate, breathing, and waking, sleep, digestion and immunity, as well as in sensory functions. Damage to the brain stem can lead to coma and death. The brain stem is divided into a series of anatomical regions. The midbrain and the pons are the forebrain structures of the brain stem. The midbrain is considered the most crucial brain area in the brain stem because damage to the midbrain will render the organism unable to function normally and will likely lead to the patient's death. The human midbrain is located directly behind the forehead and houses the olfactory bulb, as well as the pons. The pons, which is also known as the pontocerebellar junction, is the junction between the brain a1d647c40b
