The individual settings  
below can be changed  
using the customize button  
at the bottom right. You  
can also change the speed  
and re-encode the files

---

using the same configuration settings.

## Batch Conversion

There are two ways to convert videos: Using specific settings for each file/folder. When a setting is selected, the related items will be automatically selected for processing. This method is very easy to use and you can change settings by clicking the customize button. Using a set of settings for the entire

---

folder/set of files. When this option is selected, the chosen settings will be automatically applied to all selected items. This option can be very usefull if you know the exact settings you want to use for each file. It will also have effects on other settings. It is also possible to use VFR (Variable Frame Rate) encoding. The frame rate changes in real time during the conversion process,

---

allowing you to use frames as you wish. Only the H264 VFR encoder is supported.

## Configuration Settings

Most parameters can be changed for H264 and H265 encoders. This section shows what the settings look like in the default cases, but can be changed in the customization box. In the H264 configuration settings, you can also tick the 'Enable variable frame

---

rate (VFR)' box to get variable frame rate encoding, which allows you to change the frame rate. Audio configuration settings Set Output Format (MKV or MP4) Set Output Resolution (16x9, 16x10, 16x11,...)

You start by choosing the source folder containing your files. Then, you can

---

either specify individual files or an entire folder, and CudaCoder will handle the rest. Supported file formats: MKV (XAVC S), MP4 (AVC / H.264) and MKA (AAC with Bitrate / Codec Configurations). It accepts files of any length, in the range of 1-99GB. CudaCoder supports both h264 and HEVC video encoders. CudaCoder supports batch conversions, allowing you

---

to process multiple files at once. You can choose the output format, output resolution, frame rate, bit depth, quality and other options. As for audio encoders, it is compatible with AAC, AC3 and MP3. CudaCoder allows you to change the output quality, frame rate and bit depth. A few other audio and video encoding customization parameters are supported. CudaCoder is a simple GUI

...CudaCoder is a command line terminal emulator which is basically a cross between Midnight

Commander and the Windows console. It offers similar abilities to Midnight Commander, not only for managing a directory but also to manipulate files....

CudaCoder is an interesting and useful application which can be used either to manage directories, to display the contents of directories or to edit files. Once you get the hang of it, it can be a very powerful tool....

CudaCoder is a useful utility which can be used to manage files in the form of directories. Its display capabilities and editing tools are useful. I personally tend to use it to display the contents of directories rather than edit files. User Reviews: SF The interface is...NOT easy to use, and the ability to display large directories is practically...NOT important. ...So what you

get with CudaCoder is a simple interface...that hides the difficult parts of CudaCoder...in order to hide the complexity of CudaCoder...and not let you do what it's not designed to do. So basically the interface is NOT...user friendly, and hides the complex parts of it in order to confuse the user...and deny them access to those features. ...What I liked about this

program is its ability to combine things together into categories. For example, I work often with video conversion, so I can add video files to a specific folder. Once all the video files are added, I go into video conversion and CudaCoder automatically combines all the video files into one category. ...I would like to see if the program can handle a task that's not on the list. For

example, say I added music files to a playlist and want CudaCoder to add them to my audio category.

#### **What's New In?**
